

These questions complement class discussion of the paper describing *AQuery*.<sup>1</sup>

1. List the members of your group below. Underline your name.
  
2. How may the *best-profit* query of Section 1.1 be written in the standard SQL described in the textbook (no OLAP or other extensions)? Can the query be mapped to a single query? If so, provide the query. If not, explain why and provide the equivalent result using the fewest queries and suitable additional code.
